PRECISION ENGINEERING FOR MODERN FINANCE

ARCHITECTURE

Two systems, two portals

FinFlo runs two distinct identity systems behind a shared, multi-tenant core. The **business console** serves the institution's staff and owners; a separate **member portal** serves their end-customers. Both read the same tenant data under one security model.

Business console

For `super_admin`, `admin` (tenant owner), and `staff`. Run customers, loans, savings, branches, books, and reporting from one workspace.

Member portal

A white-label self-service portal where end-customers view balances, repay loans, manage savings and deposits, and move money.

Both sides authenticate with typed JSON Web Tokens — each token carries a `type` claim (`user`, `member`, pin, or 2fa-pending) and every middleware rejects tokens of the wrong type. Tokens arrive as an `Authorization: Bearer` header on mobile or a `token` cookie on the web.

Strict tenant isolation

Every business that signs up is an isolated tenant. All tenant-scoped data is scoped to its owner, so one institution can never read or write another's records.

IDENTITY & KYC

Customers & members

Onboarding captures the identity an institution is legally required to hold. CNIC (national ID) is the anchor for KYC, and sensitive personal fields are **encrypted at rest**. FinFlo distinguishes the canonical KYC record from the portal login:

ENTITY	ROLE IN THE PLATFORM
Customer	The canonical KYC entity — the verified identity (CNIC, personal data, documents) that loans, savings, and ledgers reference.
Member	The member-portal account — the end-customer's login into the self-service experience, tied back to their Customer record.

CNIC identity

Encrypted personal data

Document upload

KYC vault

MONEY — PILLAR 1

Lending

The full loan lifecycle, from credit decision to recovery, runs inside FinFlo with auditable, transactional money handling. (Lending has its own deep-dive document; this is the

summary.)

Issuance

Issue loans against per-customer credit limits.

Repayment scheduling

Structured repayment plans with a complete ledger.

Late fees

Automated late-fee accrual on overdue balances.

Default detection

Scheduled detection of defaulting loans.

Renewals

Renew loans without losing the repayment history.

Group lending

Support for group-lending structures.

MONEY — PILLAR 2

Savings & deposits

Beyond lending, institutions take and grow deposits. FinFlo runs savings and current accounts, fixed-term deposits, profit-sharing, and committee-style share capital — with profit accrued and distributed on a schedule.

Savings & current accounts
Everyday deposit accounts for members, fully ledgered.

Term deposits
Fixed-term deposits with maturity tracking and payout.

Profit accrual & distribution
Profit accrued and distributed on a scheduled basis.

Member share capital
Member shares tracked as capital for cooperatives.

MONEY — PILLAR 3

Payments & transfers

Members and the institution move money inside FinFlo and out to the wider banking system. Internal transfers settle between accounts; external transfers ride **Raast** and bank rails. Daily transfer limits and a transaction PIN protect outgoing money.

CAPABILITY	DETAIL
Internal transfers	Move funds between accounts within the tenant.
External transfers	Send over Raast and bank rails to external accounts.
Daily transfer limits	Per-day limits cap outgoing transfer volume.
Transaction PIN	Required on withdrawals and transfers as a step-up control.

TRUST — PILLAR 4

Compliance & audit

Regulated lenders carry compliance obligations, so audit is built into the core rather than bolted on. Every auditable money movement writes a ledger row, and every user action is recorded.

KYC document vault

Identity documents stored against each customer record.

AML / CTR monitoring

Anti-money-laundering and currency-transaction monitoring.

FinancialTransaction ledger

The auditable ledger of money movement across the tenant.

ActivityLog trail

A complete trail of who did what, when.

Bank-grade money handling

Multi-document money operations run in MongoDB transactions with idempotent patterns, so balances, repayments, distributions, and transfers always reconcile.

TRUST — PILLAR 5

Operations

Institutions run multiple branches and teams, and the platform keeps work both delegated and automated. Staff permissions are role-based via `Role` documents and `authorizePermissions`;

and `super_admin` bypass all checks.

Multi-branch

Branch-scoped staff and per-branch analytics under one tenant.

Role-based permissions

Granular permissions resolved from Role documents.

Real-time

Socket.io powers chat, notifications, and live branding updates.

Scheduled jobs (Asia/Karachi)

Recurring money work runs on a cron schedule in the institution's timezone:

`Overdue downgrade``Late-fee accrual``Saving-profit accrual & distribution``Default detection``Term-deposit maturity``Scheduled payments`

GROWTH — PILLAR 6

Billing & white-label

FinFlo is delivered as a SaaS with Stripe billing and webhooks, tiered plans, and white-label branding so each tenant's console and member portal carry its own identity.

Stripe billing

Subscription billing with webhook-driven plan state.

Plan tiers

Tiered plans (e.g. Free / Pro), with a contact-sales option.

White-label branding

Tenant logo and branded member portal.

Live branding

Branding updates push to clients in real time.

ANYWHERE

Mobile

The same product ships as **two native mobile apps** — one for members, one for the business — built from a single codebase and selected at runtime by `APP_MODE`. Teams and customers work from

anywhere without a separate app project to maintain.

Capabilities at a glance

PILLAR	WHAT IT COVERS
Customers & members	Onboarding & KYC, CNIC identity, encrypted data; Customer (KYC) vs Member (portal).
Lending	Issuance, repayment scheduling, late fees, default detection, renewals, credit limits, group lending.
Savings & deposits	Savings/current accounts, term deposits with maturity, profit accrual & distribution, share capital.
Payments & transfers	Internal + external (Raast / bank) transfers, daily limits, transaction PIN.
Compliance & audit	KYC vault, AML/CTR monitoring, FinancialTransaction ledger, ActivityLog trail.
Operations	Multi-branch, role-based permissions, scheduled jobs, real-time Socket.io.

CAPABILITY PILLARS

In one sentence

FinFlo gives a lending institution the complete feature surface — customers, loans, savings, transfers, compliance, operations, billing — across a business console, a member portal, and two native apps, all from one tenant.
