PRECISION ENGINEERING FOR MODERN FINANCE

THE BASICS

Customers and members

FinFlo keeps a simple distinction that matches how your institution actually works. A **customer** is the person on your books — the verified identity that your loans, savings accounts, and records are attached to. When you give that person access to their own branded app, they become a **member**: the same person, now with a self-service login to your portal.

You always see one consistent record. Everything a customer does in their app — completing their profile, uploading documents, setting up savings — flows straight back into the same record your team reviews, so the business side and the customer side never drift apart.

Customer — the record

The verified identity on your books: personal details, identity documents, accounts, and history. This is what your team works with day to day.

Member — the login

The same person, given access to your branded app so they can view balances, repay loans, manage savings, and move money themselves.

GETTING STARTED

Inviting and onboarding a customer

Bringing a customer on board starts with a single secure invitation. You send them a private invite link from your dashboard; that link is tied to their email, so only the person you intended can claim the account. When they open it, they're guided straight into a short, friendly sign-up — no paperwork to chase, no forms to mail back.

You send the invite

From your dashboard, send the customer a private invitation link to join your branded app.

Locked to the right person

The link is tied to the invited email and can't be changed, so only the intended customer can claim the account.

They start sign-up

On accepting, the customer is taken straight into the guided sign-up, ready to complete it at their own pace.

THE GUIDED SIGN-UP

A short, step-by-step setup

Sign-up walks your customer through a handful of clear steps, one at a time. Best of all, their **progress is saved automatically** — if they need to step away, they come back to exactly where they left off, with nothing to re-enter. Here's the full flow your customers experience:

STEP	WHAT THEY DO	WHAT IT CAPTURES
1	Their profile	A profile photo, their CNIC (national ID) number, and their address.
2	Work & income	Their employment and income details — useful context for lending decisions.
3	Signature	A signature they can draw on the screen or upload as an image.
4	Identity documents Required	Clear photos of both sides of their CNIC — front <i>and</i> back. Required to continue.
5	Nominee Optional	A nominee's name, CNIC, and relationship, with optional images of the nominee's CNIC.
6	Security PIN	A private 4–digit PIN that protects their money in the app.

Profile & details

Photo, identity number, address, and income — captured in a friendly, guided form.

Signature on file

Drawn on screen or uploaded — a signature your records keep for every member.

Their security PIN

A private 4–digit PIN the member sets to protect withdrawals and transfers.

No lost work

Because every step is saved as it's completed, a customer who closes the app halfway through comes back to the same place. They never re–enter a section they've already finished.

IDENTITY VERIFICATION

Know-your-customer, made simple

FinFlo gives every customer a secure document vault. Your customers upload the identity documents you need — their CNIC, a selfie, a utility bill, and more — and your staff review each one and mark it **Verified** or **Rejected**. Documents that expire can carry an expiry date, and the platform reminds you before they lapse, so your records stay current without anyone having to remember.

Document types you can collect

CNICSelfieUtility BillTax ReturnProof of ResidenceOther

The status of each one

PendingVerifiedRejectedExpired

STATUS	WHAT IT MEANS FOR YOU
Pending	The customer has uploaded the document and it's waiting in your review queue.
Verified	Your staff have checked it and confirmed it's valid — the customer is good to proceed.
Rejected	The document failed review (unclear, wrong type, or doesn't match) and needs to be re-submitted.
Expired	The document has passed its expiry date; you'll have been reminded ahead of time to refresh it.

Verify before you activate

Because identity documents carry a clear status, your team can confirm exactly who a customer is before opening accounts or lending — and the whole vault is kept private to your business.

ACCOUNTS

Accounts your members can hold

Each member can hold several kinds of account, each kept separate so balances are never mixed up. Savings and shares sit apart from everyday spending money, and a member's own account numbers are self-describing at a glance.

Current account
The everyday wallet for deposits, withdrawals, and loan proceeds.

Savings account
Held apart from everyday money and earns profit on a schedule.

Term deposit
A fixed-term deposit with a maturity date, tracked to payout.

ACCOUNT	NUMBER STARTS WITH	WHAT IT HOLDS
Current account	CUR	The main wallet — deposits and loan proceeds in, withdrawals out, plus any profit.
Savings account	SAV	Savings kept separate from everyday money; earns profit shared on a schedule.
Term deposit	—	A fixed amount locked for a set term, with a maturity date and scheduled payout.
Loan account	LON	The member's borrowing — outstanding balance and repayments are tracked here.

Account numbers are generated for each member with a prefix for their type (SAV / CUR / LON), so anyone can tell at a glance what an account is.

SAVINGS THAT GROW

Savings that earn, automatically

When your members save with you, their money works for them. FinFlo calculates each saver's profit and shares it into their savings balance on a regular schedule — you don't have to run the numbers by hand or remember to pay it out. Each account can carry its own profit rate, so different savings products can reward members differently.

**Profit, calculated for you**

The platform works out each saver's profit automatically, based on the rate set for their account.

**Shared on schedule**

Earned profit is moved into the member's savings balance on a regular cadence, with no manual step.

**Members' money, kept theirs**

Shares a member places with you are treated as the member's own money — never as your income — and are kept separate from their everyday wallet.

Built for committees and cooperatives

If your institution runs share capital or committee-style savings, member shares are always accounted for as money you owe back to the member, kept apart from their loans, and never touched to cover a repayment without the member's instruction.

MOVING MONEY

Transfers, protected and limited

Members can move money the way they expect to. They can shift funds between their own accounts, send to other people, and pay out over **Raast** and the wider banking system. Every outgoing transfer is protected by the member's private security PIN, and sensible daily limits keep any single account from sending more than it should.

Between their own accounts

Members move money between their current and savings accounts in a couple of taps.

Send to others & out to banks

Send money to other people, including over Raast and bank rails to outside accounts.

PIN-protected

Each withdrawal or transfer asks for the member's private security PIN before it goes through.

Sensible daily limits

Per-day limits cap how much can leave an account, protecting members and your business alike.

SELF-SERVICE

| The member app does the front-desk work

Your customers carry your branded app on their phone. Most of the questions and requests that used to fill your front desk — "what's my balance?", "send me my statement", "I'd like to repay" — they now handle themselves, any time of day. That frees your team to focus on lending and growth instead of routine lookups.

See balances

Members check every account balance — current, savings, shares, and loans — at a glance.

Pull statements

Members view and download their own transaction history and account statements.

Make requests

Members repay loans, manage savings, and move money from the same app — no branch visit needed.
